
ABSTRACT

a2
Audio, video, text and image presentation systems allow visitors to display facilities and other public spaces to proactively select detailed information about the various items located within such facilities and spaces. Exemplary embodiments can be used in a museum exhibition to convey detailed information relating to museum artifacts or in a convention center or retail environment to deliver information relating to products or services. Information content delivered to the user includes high-quality audio, video and static images. Through selection and bookmarking functionalities, exemplary systems link the public space elements and more detailed information delivered off-line via another medium or a fixed workstation environment. A visitor can self-guide and self-tailor the exploration of a display facility or other public space and/or extend the experience beyond the physical boundaries of the display facility or other public space.
